## Cold snap brings home heating fire safety reminder

## Thursday 1 July 2021

South Australians risk losing their homes and potentially their lives this winter if using heaters incorrectly the Metropolitan Fire Service (MFS) warns.

On average MFS and Country Fire Service (CFS) firefighters battle up to 60 house fires linked to home heating every year.

MFS Community Safety Officer, Angelo Mastripolito said many of those incidents have a common link.

"One of the leading causes of home heating fires is having clothes, bedding or other flammable items too close to heaters and open fires.

"Our rule of thumb is to keep anything flammable *two metres from the heater* this winter. That's because beds, curtains, furniture and clothes hung on clothes airers can too easily catch alight," MFS Community Safety Officer, Angelo Mastripolito said.

The MFS warns that leaving a heater switched on too close to your bed while you sleep is dangerous and poses a significant house fire risk.

MFS Community Safety Officer, Angelo Mastripolito said, "People can become too hot in their sleep, kick bedding off and continue to sleep. If a heater is too close, that can result in your bedding touching the heater, causing your bed and bedroom to catch alight. It's a situation that could quickly turn fatal".

The MFS provides the following home fire safety tips for safe heating this winter:

- Keep any items that can burn well clear of heaters and fires. Clearance from clothes, bedding, furniture, curtains and other combustibles should be at least **two metres**.
- Clothes airers placed around or near heaters and open or solid fuel fires are a high fire risk. If they fall over, clothing can end up dangerously close to the heater.
- Turn heating equipment off when you leave the house, and do not leave portable heaters running for extended periods.
- Discontinue using any faulty heating equipment immediately. Have it repaired by a qualified tradesperson or replace it with a new item.

## Portable heaters

Choose a portable heater that has an automatic safety switch that turns the heater off
if it is knocked over.

Early detection is vital. The MFS urges householders to combine these safety tips with hardwired, interconnected smoke alarms that are less than 10 years old and a Home Fire Escape Plan.
